

CONTAINERISATION IMPACT' ON THE INNOVATIVE TECHNOLOGIES IN THE SEAPORTS

Summary

The development of container shipping and investments in large vessels has created a great challenge to the whole transportation chain. The seaports with their transshipping/ storage facilities and further routes in the ports' hinterland also need to adjust to these trends, because new technologies in one part of the transport chain have so called proinnovative effect and even pressure on the neighbouring elements. Thus, the seaports should develop innovative solutions as regards their superstructure and infrastructure, intermodality and logistics facilities and services in order to survive in such a competitive global environment.
