Summary

Tending to the logistic activities is the essence to improve the functioning of the whole process and, in the result, to reduce the related costs. The sources for reducing of the logistic costs are sought, inter alia, in the optimalization of transport. The rationalization of freights on the basis of the mathematic methods provides for some economical benefits, both transport agents and service receivers. In the situation of the current crisis and by the increased competition on the transport market it is highly required to animate the implementation the optimalizing methods. This article is intended for the optimalization of the transport process by taking into account of the above mentioned reasons.
