THE FORM OF CARGO AS A DETERMINANT OF TRANSPORT TECHNOLOGY SELECTION

SUMMARY

Seeking for methods that will increase a degree of integration of the transportation processes realisation, results not only from the possibility of limiting the organisational activities and shorting their duration, but mainly from optimal selection of the production resources to the adopted transport technologies.

Despite using different methods increasing cargo transport capacity satisfying results have not been achieved yet.

The reasons of this state are financial difficulties and therefore a lack of necessary technical resources and low economic efficiency of such projects.

Transport technology is determined by the form and packing of the cargo because the same cargoes could take different forms depending on the used device that increase their transport capacity.
