

## **THE CONCEPT OF COMBATING DIGITAL EXCLUSION OF THE +55 GENERATION**

### **Summary**

In order to counter adverse demographic and social phenomena as well as their economic effects, it is necessary to develop and implement a model of enhancing IT skills of the older generation and other social groups in danger of digital exclusion. The model, which aims at practical inclusion of people aged 55+ into the processes of active formation and development of IT society, should be based on the organisation and support, mainly at regional level, of training seminars that enhance vocational and non- vocational IT competences of the older generation.
