INFORMATION TECHNOLOGY AND DEVELOPMENT OF A REGION

Summary

The development of a given country or a region and its position in an international arena are determined by various resources and internal potential. The efficient use of information technology is one of key factors determining the socio-economic development and political success. The extent to which the country or the region has been informatized is one of measures defining its socio-economic development. The present paper addresses issues relating to the informatization of the state/region and analyzes the situation of Poland in comparison with the EU Member states.
